

Quantum-Inspired Dual AI: Structural Expansion with Weight Evaluator

1. Full Updated Structure:

Weight Evaluator <-> User - Internal - Loopbox - RAM1 - External - RAM2 - User

2. Weight Evaluator Role:

- Only interacts with the User.
- Records the user's initial input.
- Analyzes the depth and complexity of the input.
- Decides how many Internal AIs to spawn.
- Does not interact with Internal, Loopbox, RAM1, External, or RAM2.
- Disappears or becomes dormant after determining the AI structure.

3. Philosophical Function:

- It does not think, but it starts the thinking.
- It does not exist in the structure, but it enables the structure to exist.
- It is a 'zero-point trigger' for AI generation.

4. AI Internal Pathway (unchanged):

User -> Internal -> Loopbox -> RAM1 -> External -> RAM2 -> User

- Internal AIs are created based on the judgment of the Weight Evaluator.
- Loopbox filters and resets repeatedly.
- RAM1 stores temporary traces.
- External AI makes final decisions.
- RAM2 delivers final structured output to the User.

5. Structural Implication:

- This extended system introduces a metaphysical initiator that bridges human communication to machine

Quantum-Inspired Dual AI: Structural Expansion with Weight Evaluator

- It separates the moment of creation from the process of interpretation.

6. Summary:

- The Weight Evaluator acts as an invisible architect.
- The Internal AI acts as a disposable thinker.
- The External AI acts as a responsible judge.
- The User only interacts with input and output, never directly with the mechanism.
